

Did You Know?

Biostimulants!

Biostimulants are a broad range of natural products that enhance plant growth and soil health, which leads to reduced fertilisers and pesticides to produce food and manage landscape areas, golf courses and sports pitches. Biotechnica produces two main types of products:

- **Seaweed extracts:** full of bioactive compounds that help the plant to take up nutrients from the soil, move them around the plant more efficiently, stimulates the plants natural defences against disease attack, helps the plant to withstand and recover from damage and feed soil microbes.
- **Beneficial soil microbes** that help to ward off plant diseases, enhances the break down organic matter to release trapped nutrients, creates soil structure that allows surface drainage and air to enter the soil.

The combined effect of using Biotechnica's products are reduced fertiliser and pesticides that damage the environment, increased crop yields and profitability for farmers, safer treatments for farm and landscape staff. [Learn more.](#)
